Website Implementation Guide

Resolve Physical Therapy — Bend, Oregon

Your step-by-step guide to launching your new website

Estimated total time: 2–3 hours

No technical experience required

You have a complete, ready-to-go website built with standard web files (HTML, CSS, and JavaScript) — no fancy frameworks or databases required. To get it live on the internet, you need to do four things: make a few text edits, set up a free form service, upload everything to a hosting provider, and handle basic privacy items. **Total: 2–3 hours**

Roadmap — Do These Steps In This Order

Step 1: Edit Your Website Files — ~60–90 min

Edits #1–#12: Critical fixes (phone, email, photos, forms, video, maps)

Edits #13–#16: Polish items (favicon, privacy links, OG images)

Step 2: Set Up Your Contact Forms — ~15 min

Web3Forms (recommended), Formspree, or Netlify Forms

Step 3: Choose Hosting & Go Live — ~30 min

Netlify (easiest), Cloudflare Pages (fastest), or Namecheap (email included)

Step 4: Privacy, Legal & Compliance — ~15 min

HIPAA, privacy policy, accessibility, Google Business Profile

ⓘ **Why this order?** If you upload your site first and then make edits, you have to upload again. By editing first, you only upload once and your site is ready from the moment it goes live.

Before You Begin

What You Need:

Notepad++ installed — free download: `notepad-plus-plus.org/downloads/`
Your website folder on your computer (the folder with `index.html`, `services.html`, `about.html`, `contact.html`)
About 2–3 hours of focused time

How Find & Replace Works (You Will Use This a LOT):

1. With the file open in Notepad++, press **Ctrl+H** on your keyboard
2. In the **Find what:** box, paste exactly what the instructions say
3. In the **Replace with:** box, paste exactly what the instructions say

4. Click **Replace All** (or just **Replace** to go one at a time)
5. Press **Ctrl+S** to save the file

> 💡 **If Notepad++ says "0 replacements found"** — the spacing in your file might be slightly different. Try using Ctrl+F (Find) first to locate the text, then edit it by hand. The important thing is finding the right text and changing it.

1 Editing Your Website with Notepad++

Personalize content, fix placeholders, add your real photos

Critical Fixes — Your Site Won't Work Without These

EDIT #1 Download the Hero Image Locally

File: index.html

Problem: The hero banner photo loads from an external server (Unsplash). If that server goes down, your hero shows a broken image.

Step 1: Download the image

1. Open `index.html` in Notepad++ and look for a line containing an Unsplash URL
2. Copy that entire URL, paste it in your browser, press Enter
3. Right-click the image → **"Save image as..."**
4. Save into your `images` folder as **hero.jpg**

Step 2: Update the code

🔍 **FIND WHAT:**

```
https://images.unsplash.com/photo-... (the full URL you copied)
```

→ **REPLACE WITH:**

```
images/hero.jpg
```

> ✅ **Done!** Your hero image now loads from your own files.

EDIT #2 Fix the YouTube Video Embed

File: index.html **Line:** ~335

Problem: The video section shows `YOUR_VIDEO_ID` instead of a real video.

Get your YouTube video ID:

From a URL like `youtube.com/watch?v=dQw4w9WgXcQ`, the video ID is the code after `v=`

🔍 **FIND WHAT:**

```
https://www.youtube.com/embed/YOUR_VIDEO_ID
```

→ **REPLACE WITH:**

```
https://www.youtube.com/embed/PASTE_YOUR_ID_HERE
```

💡 **No video yet?** You can skip this edit for now. The section will just show a blank player.

✅ **Done!** Your YouTube video displays properly.

EDIT #3 Fix the Fake Phone Number on the Services Page

File: services.html **Line:** ~336

Problem: The services page footer shows `(541) 000-0000` instead of your real number.

🔍 **FIND WHAT:**

```
(541) 000-0000
```

→ **REPLACE WITH:**

```
(541) 306-1099
```

✅ **Done!** Correct phone number now shows on the services page.

EDIT #4 Fix the Wrong Email on the Services Page

File: services.html **Line:** ~343

Problem: Footer shows `info@resolveptbend.com` which is not your real email.

🔍 **FIND WHAT:**

```
info@resolveptbend.com
```

→ **REPLACE WITH:**

```
resolveptbend@gmail.com
```

✅ **Done!** Correct email now shows.

EDIT #5 Add Full Street Address to Services Page

File: services.html **Line:** ~330

Problem: The services page footer only says "Bend, Oregon" with no street address.

🔍 **FIND WHAT:**

```
<span>Bend, Oregon</span>
```

→ **REPLACE WITH:**

```
<span>1740 NW Pence Ln Suite 5<br>Bend, OR 97703</span>
```

💡 The `<br>` tag creates a line break so the address appears on two lines.

✅ **Done!** Full address now shows on the services page footer.

EDIT #6 Fix Social Media Placeholder Links

Problem: Several pages have social icons that link to `#` (nowhere).

Edit #6A: Fix Social Links on `services.html`

Three social icons (Facebook, Instagram, Google) need fixing:

Facebook:

🔍 **FIND WHAT:**

```
<a href="#" class="footer__social-link" aria-label="Facebook">
```

→ **REPLACE WITH:**

```
<a href="https://www.facebook.com/resolveptbend" class="footer__social-link" aria-label="Faceboo
k" target="_blank" rel="noopener noreferrer">
```

Instagram:

🔍 **FIND WHAT:**

```
<a href="#" class="footer__social-link" aria-label="Instagram">
```

→ **REPLACE WITH:**

```
<a href="https://www.instagram.com/resolveptbend" class="footer__social-link" aria-label="Instag
ram" target="_blank" rel="noopener noreferrer">
```

Google (Option A — link to Google Business Profile, or Option B — delete the icon):

🔍 **FIND WHAT:**

```
<a href="#" class="footer__social-link" aria-label="Google">
```

→ **REPLACE WITH:**

```
<a href="https://g.page/resolveptbend" class="footer__social-link" aria-label="Google Business P
rofile" target="_blank" rel="noopener noreferrer">
```

Or delete lines 359–365 entirely to remove the Google icon.

Edit #6B: Fix Social Links on `contact.html`

Repeat the same Facebook and Instagram replacements for `contact.html`.

💡 `target="_blank"` opens links in a new tab. `rel="noopener noreferrer"` is a security best practice.

✅ **Done!** All social media icons now link to your real profiles.

EDIT #7 Connect the Contact Forms

Problem: Both contact forms do nothing when submitted — no email is sent, no data saved.

> 📋 Your contact forms need a backend service. **Complete setup instructions are in Step 2 (page 8+).** Do that section next, then come back for Edit #8.

EDIT #8 Fix Dead "Careers" Links

Problem: Every page has "Careers" links in the nav bar and footer that go nowhere.

Option A: Link to a real careers page or job posting

In each file, replace `href="#"` on Careers links with your real URL.

Option B: Remove the Careers links entirely (recommended if not hiring)

Each file uses slightly different HTML for the Careers nav link. Do these Find & Replace operations:

In `index.html`: Find `<a href="#" class="nav__link">Careers</a>` → Replace with nothing

In `services.html`: Find `<li><a href="#" class="nav__link">Careers</a></li>` → Replace with nothing

In `about.html`: Find `<li role="none"><a href="#" class="nav__link" role="menuitem">Careers</a></li>` → Replace with nothing

In `contact.html`: Same as services.html

Footer (all 4 files): Find `<a href="#" class="footer__link">Careers</a>` → Replace with nothing

> ✅ **Done!** No more dead Careers links.

EDIT #9 Replace Team Photo Placeholders with Real Headshots

File: about.html

Problem: All five team members show generic gray icons instead of real photos.

Step 1: Prepare Your Photos

1. Get a headshot for each team member
2. Resize to approximately **400 × 400 pixels** (square)
3. Save as JPG, under **200KB** each
4. Name them: `jenny.jpg`, `kasey.jpg`, `nate.jpg`, `sarah.jpg`, `ethan.jpg`
5. Place all photos in the `images` folder

> 💡 Free resizing: `iloveimg.com/resize-image` — set width and height to 400.

Step 2: Replace the SVG Placeholders

For each team member, use Ctrl+H to find the SVG placeholder block and replace it with an `<img>` tag. The guide provides exact find/replace strings for all five: **Jenny McAteer**, **Kasey Lohman**, **Nate Palmer**, **Sarah Consiglio**, and **Ethan Bruno**.

The pattern for each is:

🔍 **FIND: (THE SVG PLACEHOLDER BLOCK INCLUDING THE PERSON'S NAME)**

```
<div class="team-card__image" style="background-color: ...">
  <svg ...>...</svg>
</div>
```

→ **REPLACE WITH:**

```
<div class="team-card__image">
  <img src="images/name.jpg" alt="Full Name - Physical Therapist" loading="lazy" style="width: 1
00%; height: 100%; object-fit: cover;">
</div>
```

> ⚠️ File names are **case-sensitive** on some web servers. Use all lowercase: `jenny.jpg`, not `Jenny.jpg`.

> ✅ **Done!** All five team members now show real headshot photos.

EDIT #10 Replace Clinic Photo Placeholders

Files: index.html & about.html

Problem: Both pages have a gray placeholder where a clinic photo should appear.

Prepare & Replace:

1. Get a good photo of your clinic — resize to ~**800 × 450 px**
2. Save as `clinic.jpg` in the `images` folder
3. In each file, find the gray placeholder `<div>` with SVG and replace with:
   `<img src="images/clinic.jpg" alt="Resolve Physical Therapy clinic in Bend, Oregon">`

> ✅ **Done!** Real clinic photos appear on home and about pages.

EDIT #11 Fix the Google Maps Embed

File: contact.html **Lines:** ~204–210

Problem: The map shows a generic/approximate location using placeholder coordinates.

Get your real embed URL:

1. Go to `google.com/maps` and search for your business
2. Click **Share** → **Embed a map**
3. Click **COPY HTML**
4. From the copied code, extract just the URL inside `src="..."`

🔍 **FIND WHAT:**

```
https://www.google.com/maps/embed?pb=!1m18!1m12!1m3!1d2867.5!2d-121.33!3d44.06...
```

→ **REPLACE WITH:**

```
YOUR REAL GOOGLE MAPS EMBED URL
```

⚠️ The URL should start with `https://www.google.com/maps/embed?pb=` — if it starts with `<iframe` you copied too much.

✅ **Done!** Your exact location now shows on the contact page.

EDIT #12 Fix the "Download Intake Form" Link

File: contact.html **Line:** ~265

Problem: The "Download Intake Form" button links to `#` and does nothing.

If using a PDF file: Save your intake form as `intake-form.pdf` in your website folder, then:

🔍 **FIND WHAT:**

```
<a href="#" class="btn btn--outline btn--small" style="margin-top: var(--space-lg);">
```

→ **REPLACE WITH:**

```
<a href="intake-form.pdf" class="btn btn--outline btn--small" style="margin-top: var(--space-l
g);" download>
```

If using an online link (e.g., from Prompt EMR): replace `href="#"` with your real URL and add `target="_blank"`.

> ✅ **Done!** The intake form button now works.

🎉 Checkpoint: Critical Edits Complete!

If you've completed Edits #1–#12, your website is fully functional. The edits below are polish — they make your site more professional but aren't required. Take a break if you need one!

Nice-to-Have Fixes

Not urgent, but they make your website more polished and professional.

EDIT #13 Add a Favicon (Browser Tab Icon)

1. Go to `favicon.io` — upload your logo or create a text-based "R" icon
2. Download and place `favicon.ico` in your `images` folder
3. In all 4 HTML files, add this line before the Google Fonts `<link>`:
   `<link rel="icon" href="images/favicon.ico" type="image/x-icon">`

> ✅ **Done!** Your icon appears in browser tabs.

EDIT #14 Fix Privacy Policy Links

Problem: Privacy Policy links in `about.html` and `contact.html` go nowhere.

Option A: Use `freeprivacypolicy.com` to generate a hosted policy, then replace `href="#"` with the URL.

Option B: Remove the links entirely (replace the entire link tag with nothing).

> ✅ **Done!** Privacy links are now functional or removed.

EDIT #15 Update the Review Count

File: index.html

The site says "201+ Five-Star Reviews." Update to your current count using Find & Replace:

🔍 **FIND WHAT:**

```
201+
```

→ **REPLACE WITH:**

```
250+ (your current count)
```

Also update: `"reviewCount": "201"` → `"reviewCount": "250"`

> 💡 Set a quarterly calendar reminder to update this number.

EDIT #16 Add OG Images for Social Media Sharing

When someone shares your site on Facebook or LinkedIn, a preview image appears. Create a **1200 × 630 px** image saved as `og-image.jpg` in your `images` folder, then add an OG meta tag in the `<head>` of each page:

```
<meta property="og:image" content="https://resolveptbend.com/images/og-image.jpg">
```

> 💡 Test OG images at `opengraph.xyz` after your site is live.

Editing Master Checklist

Critical Fixes

- [ ] **Edit #1** — Hero image downloaded locally
- [ ] **Edit #2** — YouTube video ID replaced
- [ ] **Edit #3** — Phone number fixed in services.html
- [ ] **Edit #4** — Email fixed in services.html
- [ ] **Edit #5** — Street address added to services.html
- [ ] **Edit #6** — Social media links fixed

- [ ] **Edit #7** — Contact forms connected (Step 2)
- [ ] **Edit #8** — Careers links fixed or removed
- [ ] **Edit #9** — Team photos added
- [ ] **Edit #10** — Clinic photo placeholders replaced
- [ ] **Edit #11** — Google Maps embed updated
- [ ] **Edit #12** — Intake form link fixed

Nice-to-Have Fixes

- [ ] **Edit #13** — Favicon added
- [ ] **Edit #14** — Privacy Policy links fixed
- [ ] **Edit #15** — Review count updated
- [ ] **Edit #16** — OG images added

2 Making Your Forms Work

Connect your contact forms so patient inquiries reach your inbox

Your website has two forms on the Contact page — but they don't actually send anywhere yet. This section connects them so submissions arrive in your inbox like regular emails.

Your Two Forms in `contact.html`

1. **Contact Form** (line ~88) — Name, Email, Phone, Service Interest, Message
2. **Booking Form** (line ~314) — Name, Email, Phone, Date, Time, Notes

A Web3Forms RECOMMENDED

FREE TIER	SETUP TIME	COST	ACCOUNT NEEDED?
250/month	~5 min	Free	No (just email)

Setup Steps:

1. Go to **web3forms.com**, enter `resolveptbend@gmail.com`, get your access key via email
2. In `contact.html`, change `action="#"` to `action="https://api.web3forms.com/submit"` on both forms
3. Add two hidden inputs right after each `<form>` tag:

```
<input type="hidden" name="access_key" value="YOUR-ACCESS-KEY-HERE">
<input type="hidden" name="subject" value="New Contact Form - Resolve PT">
```

4. Use different subject lines for each form so you can tell them apart in your inbox

REQUIRED **Fix the JavaScript That Blocks Form Submission**

⚠️ **Most Technical Edit** — Take your time. If you get stuck, it's okay to ask a tech-savvy friend for help.

File: js/main.js **Lines:** ~345–352

The JavaScript currently blocks ALL form submissions — even valid ones. Both the "error" and "success" branches call `e.preventDefault()`, which stops the form from actually sending.

🔍 **FIND WHAT:**

```
        } else {
          e.preventDefault();
          alert('Thank you! Your message has been submitted successfully. We will get back to yo
u shortly.');
          form.reset();
        }
```

→ **REPLACE WITH:**

```
        }
        // If valid, the form submits normally to Web3Forms
```

⚠️ Only change the lines above. If you accidentally delete a curly brace `}`, the entire JavaScript file will break. Press **Ctrl+Z** to undo if anything goes wrong.

Alternative Options

Feature	Web3Forms	Formspree	Netlify Forms
Free submissions/month	**250**	50	100
Account required?	No (just email)	Yes	Yes (Netlify hosting)
Submission dashboard	No	Yes	Yes
Setup difficulty	**Easiest**	Easy	Easiest (if on Netlify)

Testing Your Forms

1. Open your website and go to the Contact page
2. Fill out the contact form with your own info and click **Send Message**
3. Check your Gmail inbox (and spam folder) — you should receive it within 1–2 minutes

4. Repeat with the booking form
5. Test error handling: leave a required field blank — you should see the validation error

Forms Checklist

- [ ] Signed up for a form service
- [ ] Updated `action="#"` on both forms
- [ ] Added hidden input fields (access key, subject)
- [ ] Fixed JavaScript in `js/main.js`
- [ ] Tested contact form — received email
- [ ] Tested booking form — received email
- [ ] Tested validation — errors still work

3 Choose Your Hosting & Go Live

Upload your site to the internet — pick one provider

No wrong answer here. All three options get your site live and looking great. Pick the one that feels right — you can always switch later.

A Netlify RECOMMENDED FOR BEGINNERS

COST	SSL	BEST FOR
Free Forever	Free Auto HTTPS	First-timers

Why Netlify? You drag a folder onto a webpage and your site is live. Built-in form handling too.

Deploy Your Site:

1. Go to `netlify.com` and create a free account
2. On your dashboard, find the dotted-line drag-and-drop area
3. Open File Explorer, find your website folder
4. **Drag the entire folder** onto the dotted-line box in your browser
5. Your site is live! Netlify gives you a URL like `random-words.netlify.app`

Connect Your Domain:

1. In Netlify → **Site Settings** → **Domain Management** → **Add custom domain**
2. Type `resolveptbend.com` and verify
3. At your domain registrar, add a **CNAME record**: Host = `www`, Value = your Netlify URL
4. Wait 5 min to 48 hours for DNS to update (usually under 1 hour)
5. SSL activates automatically once the domain is connected

B Cloudflare Pages — Best Free Performance

COST	SSL	BEST FOR
Free (unlimited)	Free	Fastest loading

Why Cloudflare? One of the world's largest networks. Your site loads from servers near every visitor.

1. Go to `dash.cloudflare.com` and create a free account
2. Click **Workers & Pages** → **Create** → **Pages** tab → **Upload assets**
3. Name your project (e.g., `resolvept`)
4. Drag your website folder in and click **Deploy site**

Note: Cloudflare Pages does not have built-in forms — use Web3Forms or Formspree (Step 2).

C Namecheap — Best if You Want Email Hosting Too

COST	SSL	BEST FOR
~$1.48/mo (yr 1)	Free AutoSSL	Professional email

Why Namecheap? Get `jenny@resolveptbend.com` email included with hosting.

1. Get the **Stellar** shared hosting plan at `namecheap.com`
2. Log into dashboard → **Go to cPanel** → **File Manager**
3. Navigate to `public_html` → Upload all your website files
4. Your site is live at your domain

> 💡 Zip your website folder, upload the zip, then use cPanel's **Extract** button for easier uploading.

Domain Name Options

Registrar	Annual Cost	Notes
Cloudflare Registrar	**~$10.46/yr**	Cheapest — no markup
Porkbun	~$11.08/yr	Clean interface, good support
Namecheap	~$13.48/yr	Convenient if hosting there too

> 💡 **Don't panic if your site doesn't appear immediately** after changing DNS settings. The internet needs time to spread the word. Go get a coffee, check again in 30 minutes.

Hosting Checklist

- [ ] Signed up for a hosting provider
- [ ] Uploaded all website files
- [ ] Site loads at the temporary URL
- [ ] Clicked through all 4 pages to confirm they work
- [ ] Connected custom domain (`resolveptbend.com`)
- [ ] SSL/HTTPS is active (padlock icon visible)

4 Privacy, Legal & Compliance

Handle basic privacy, accessibility, and Google Business items

4A: Do You Need HIPAA Compliance?

✅ **Short answer: No, not for this website.**

Your contact forms collect **name, email, phone, and a message** — none of which is Protected Health Information (PHI). You're in the clear.

⚠️ **One important warning:** Do NOT add form fields asking visitors to describe specific health conditions, injuries, or diagnoses. That could cross the line into collecting PHI.

If you ever want **online intake forms** collecting health history, use a HIPAA-compliant platform:

Jane App (janeapp.com) — popular with PT clinics
IntakeQ (intakeq.com) — specializes in online intake
Prompt EMR's patient portal — check if it supports this

4B: Privacy Policy

Recommended but not legally required for a small clinic site. Builds trust with visitors.

What to include:

1. What information you collect (names, emails, phones from forms)
2. How you use it (respond to inquiries, schedule appointments)
3. Who you share it with (nobody except the form delivery service)
4. Third-party services (Google Fonts — Google receives visitor IP addresses)
5. Contact info for privacy questions

Create a `privacy-policy.html` page using the template provided in the full guide. Then update all footer "Privacy Policy" links from `href="#"` to `href="privacy-policy.html"`.

4C: Do You Need a Cookie Banner?

✅ **No, you do not.** Your website uses no cookies, no analytics, no tracking scripts, and no advertising pixels. Cookie consent banners are only required when your site places cookies on visitors' devices.

If you add Google Analytics or Facebook Pixel later, you WILL need a banner at that point.

4D: ADA/WCAG Accessibility

Federal deadlines: 15+ employees by **May 2026**; smaller practices by **May 2027**.

> ✅ **Your website was built with accessibility as a priority.** Already in place: semantic HTML, skip links, form labels, ARIA attributes, keyboard navigation, high contrast text.

Rules for when you edit:

Always add descriptive `alt` text to images
Use headings in order (h1 → h2 → h3, never skip)
Use descriptive link text (not "Click here")
Check color contrast at `webaim.org/resources/contrastchecker/`

4E: Google Business Profile

1. Go to `business.google.com` and sign in
2. Find your Resolve Physical Therapy listing
3. Click **Edit profile** → update the **Website** field to `https://resolveptbend.com`
4. While there, verify: business name, address, phone, hours, categories, and photos

Legal & Privacy Checklist

- [ ] Confirmed: forms do NOT collect health information
- [ ] Created `privacy-policy.html` page
- [ ] Updated Privacy Policy footer links in all 4 HTML files
- [ ] Verified: no cookie banner needed
- [ ] All images have descriptive `alt` text
- [ ] Headings used in proper order
- [ ] Google Business Profile updated with new website URL

Updating Your Site After Future Edits

After your site is live, you'll occasionally need to make changes. Here's how to re-upload for each provider:

Netlify

1. Log in to `app.netlify.com` → click your site → **Deploys** tab
2. Drag your updated website folder onto the deploy area
3. Changes are live within seconds

Cloudflare Pages

1. Log in to `dash.cloudflare.com` → **Workers & Pages** → your project
2. Click **Create deployment** → **Upload assets**
3. Drag your updated folder in → click **Deploy site**

> 💡 Cloudflare keeps deployment history. You can roll back if something goes wrong.

Namecheap (cPanel)

1. Log in → **Go to cPanel** → **File Manager** → `public_html`
2. Upload only the files you changed
3. Overwrite when prompted — changes are live immediately

General Tips for Updates

Always test locally first. Open your edited HTML files in your browser before uploading.
Keep a backup. Copy your website folder before major changes (e.g., `Website Backup - Feb 2026`).
Clear your browser cache. Press **Ctrl+Shift+R** if changes don't appear after re-uploading.

You Did It!

Your website is complete and live on the internet. Your forms deliver messages to your inbox, your privacy bases are covered, and your site is built to be accessible.

Every potential patient who reaches out through your website is a real person looking for help. Making sure their message reaches you is worth every minute of this setup.

Resolve Physical Therapy — 1740 NW Pence Ln Suite 5, Bend, OR 97703

(541) 306-1099 | resolveptbend@gmail.com

Website Implementation Guide — Prepared February 2026
